

# **GHD** Contamination assessment & remediation

**In addition to human health and environmental impacts, contamination of land can have major economic, legal and planning implications for landowners and the wider community.**

**Identifying needs**

Our clients tell us of their need for surety. The way that contaminated land issues are managed can have a significant financial impact to projects and property transactions. These are typically complex issues and a pragmatic, tailored approach is the key to reaching an outcome that minimises the impact to your project and bottom line.

**Services**

To help you achieve the ultimate project outcome, we can assist with a full spectrum of contaminated land services including:

- Phase 1 and phase 2 environmental site investigations
- Contaminated land auditing
- Remediation planning and implementation
- Human health and ecological risk assessment
- Due diligence and financial contamination-liability assessment
- Property portfolio risk assessment

Our contaminated land services are delivered by teams of integrated professionals across the globe. Our mobility and global reach means that you will have access to the right people in all contaminated land disciplines including hydrogeology, toxicology, soil science, risk assessment and remediation technologies.

**Benefits**

There are significant cost benefits in getting the right advice first up; the cornerstone of our approach is to apply pragmatic yet

innovative solutions to minimise the impact of contamination to your project or business. Our objective is to maximise value by providing quality advice tailored to your specific requirements. While others provide reports identifying problems, we focus on addressing the problems.

The breadth of our team means we have an active involvement in steering of public policy. We apply this knowledge to our projects so our clients can benefit from advancements in the regulatory landscape.

We're a leader in the application of new assessment and remediation technologies. We remain deliberately unaffiliated with specific technology providers, enabling us to independently assess and recommend technologies to deliver the best application to suit your needs.

Contaminated land management draws upon a range of auxiliary services including process engineering, geotechnical services, civil engineering and stakeholder engagement. As a multidisciplinary team, we can minimise the time and cost to you by integrating each of these project elements.

**What to expect**

We are committed to providing you with a service that is tailored and brings to the table the specific experience and track record required to achieve project success.

Our contaminated land group has a strong culture of problem solving to create value for our clients. By partnering with GHD, you'll be working with a group that is passionate about the discipline, and committed to achieving your goals.
